

New cooling fan

We are pleased to announce a new technical enhancement to our EOS Quattro engine – the addition of a cooling fan. In certain paramotor applications, airflow to the rear of the engine can be limited. With the new fan installed, testing has shown a temperature reduction of approximately 30°C at the oil pump cover and the generator. This significant decrease in operating temperature contributes to improved engine durability and helps minimize the risk of oil leakage and generator damage.

Oil pressure sensor

Additionally, we would like to introduce the **new oil pressure sensor** which is available from now on.
