

QUATTRO

THE REAL RETRO FLYING POWER

The EOS QUATTRO has now been successfully on the market for three years. Despite some minor technical challenges at the beginning, we have been able to continuously improve the engine, and we are now proud to produce a truly mature and reliable powerplant.

New oil cooling system

As we continue to receive requests for specialized applications - especially for micro aircrafts and delta trikes, we have developed a highly efficient oil cooling system. This new system weighs only a little bit over 500 grams and lowers the engine oil temperature by more than 30 °C.

The system is suitable for both paramotor operation and ultralight aircraft construction, significantly expanding the EOS QUATTRO's range of applications. It is entirely optional, with no obligation or risk associated with its installation. However, if your engine tends to run at higher temperatures, we recommend considering this addition.

If you would like further information or technical details, please contact us.
